Sonic Drill Corporation has opened its new manufacturing facility in Chilliwack, British Columbia, Canada. This 'purpose built' plant includes two floors of offices and manufacturing space that allows for future expansion.

Sonic's new facility took approx. nine months to build and features seven open bays to allow equipment to easily enter and exit. It also houses overhead cranes that provide for quicker assembly of sonic drill rigs.

Sonic Drill Corp.-manufactured rigs have distinguished themselves by offering superb performance in overburden soil conditions.

Thanks to their patented drill heads, these rigs can drill three to five times faster than any other drill on the market.

In addition to their amazing speed, sonic rigs can drill, case, loop and grout in one easy operation, making them the perfect choice for geothermal installations.

And last, but not least, sonic drill rigs can provide continuous, undisturbed core samples to a depth of 300 feet – a significant advantage over other drills – all without the use of drilling mud and with 70-80% less waste.
